West Bengal Simulation: 10 Anchor Constituencies — Vote Share & Seat Shifts (2019 LS → 2021 AE → 2024 LS)

Purpose: Calibration data for persona-based simulation of the 2026 Assembly Election. Each constituency's three-election trajectory reveals the *direction*, *magnitude*, and *velocity* of voter behaviour shifts in response to event shocks (CAA, Cyclone Amphan, Lakshmir Bhandar rollout, SSC scam, Sandeshkhali, R.G. Kar). These deltas are what the simulation's vote-choice function must reproduce.

Data source convention:

- 2019 figures = Lok Sabha AC-segment shares (votes polled within the AC, aggregated to the LS parent)
- 2021 figures = direct Assembly Election AC-level shares
- 2024 figures = Lok Sabha AC-segment shares
- Sources: Indiastat constituency factbooks, ECI statistical reports, Wikipedia AC pages, OneIndia, ProNeta. Where direct AC-segment data unavailable, parent LS-constituency averages are used and flagged.

Important note on AC numbers: I'm correcting AC numbers from my earlier list. Verified numbers are below.

---

1. NANDIGRAM (AC #210, Purba Medinipur, parent LS: Tamluk)

Archetype: A7 — Mahishya OBC coastal | Strong polarization signal seat

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Tamluk parent)	~50%	~36%	~10% (Left)	Dibyendu Adhikari (TMC, then defected)	1.9 lakh
2021 AE	**47.6%** (Mamata, 1,08,808 votes)	**48.5%** (Suvendu, 1,10,764 votes)	2.7% (CPI[M] Minakshi Mukherjee)	**Suvendu Adhikari (BJP)**	**1,956 votes**
2024 LS (Tamluk parent)	~46%	~50% (Abhijit Gangopadhyay won)	~3% (Left)	BJP	77,733 votes

Behavioural signal: This seat has flipped to BJP and stayed there. The 2019 → 2021 → 2024 trajectory shows BJP consolidating the Mahishya OBC + UC Hindu vote at ~50% with TMC oscillating in the 46–48% band. **Polarization is locked in; not a swing seat.** The persona

simulation should produce ~50% BJP / ~47% TMC / ~3% Left with a hair-thin margin in either direction. If the model produces a >5 pp gap, the OBC weighting is wrong.

---

2. BHABANIPUR (AC #159, Kolkata, parent LS: Kolkata Dakshin)

Archetype: A5 — Urban Kolkata bhadralok + Hindi/Gujarati mixed | CM-incumbent dynamic

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Kolkata Dakshin parent)	~48%	~36%	~12% (CPI[M])	Mala Roy (TMC)	1.5 lakh
2021 AE (Sobhandeb Chattopadhyay)	~57.7%	~35.3%	~5%	Sobhandeb Chattopadhyay (TMC)	~28k
2021 by-poll (Mamata Banerjee, Sep 2021)	**71.9%** (85,263)	**22.3%** (Tibrewal, 26,428)	3.6% (CMP/Left)	**Mamata Banerjee**	**58,835 votes**
2024 LS (Kolkata Dakshin parent)	~52% (Mala Roy won)	~37%	~9%	TMC	1.87 lakh

Behavioural signal: The 2021 by-poll is an outlier (CM personal contest = anomalously high TMC); the 2021 AE main poll number (~57% TMC, 35% BJP) is more representative. Across the three benchmark elections, BJP is stable at 35–37% and TMC at 48–58% — **a stable safe TMC seat with a 12–20 pp lead**. The simulation should produce ~52–58% TMC / ~35–37% BJP / ~5–10% SDA. If it shows BJP within 5 pp of TMC here, urban UC weights need recalibration.

---

3. BONGAON UTTAR (AC #95 SC-reserved, North 24 Parganas, parent LS: Bangaon SC)

Archetype: A2 — Matua/Namasudra belt | CAA-SIR cross-pressure stress test

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Bangaon parent)	**40.92%**	**48.85%**	6.4% (CPI[M]) + 1.6% INC	Shantanu Thakur (BJP)	1.1 lakh
2021 AE	42.5% (87,273)	**47.6%** (97,761)	5–7% combined	**Ashok Kirtania (BJP)**	**10,488 votes**
2024 LS (Bangaon parent)	**43.25%**	**48.19%**	4.4% (INC)	Shantanu Thakur (BJP)	~73k

Behavioural signal: This is the cleanest example in our 10-seat sample of **BJP's locked-in Matua bloc**. BJP held 48–49% across all three elections; TMC moved up modestly from 41% → 43%; Left collapsed from 6.4% → essentially zero. The seat is structurally BJP. **The 2026 question:** does Matua disillusionment with delayed CAA implementation + SIR deletions in their colonies erode the 5 pp BJP lead? Persona simulation should produce ~48% BJP / ~43% TMC / ~5% other. The model's Matua-SC weight is the load-bearing parameter here.

---

4. SANDESHKHALI (AC #123 ST-reserved, North 24 Parganas, parent LS: Basirhat)

Archetype: A6 — South Bengal mix with ST reservation | Sandeshkhali violence local-effect test

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Basirhat parent)	~57%	~28%	~9%	Nusrat Jahan (TMC)	3.5 lakh
2021 AE	**54.6%** (Sukumar Mahata, 1,12,450)	**35.4%** (Bhaskar Sardar, 72,765)	~5% combined	**Sukumar Mahata (TMC)**	**39,685 votes**
2024 LS (Basirhat parent — post Sandeshkhali)	~55% (Haji Nurul Islam)	~31% (Rekha Patra, the Sandeshkhali victim-candidate)	~6%	TMC	3.33 lakh

Behavioural signal: This is the most counter-intuitive datapoint in the entire 10-seat set. The Sandeshkhali violence (Jan–Feb 2024) and Rekha Patra's BJP candidacy were national news; yet TMC's vote share at LS level barely moved. **The local Sandeshkhali AC behaved no differently from the rest of Basirhat LS.** This tells us national narrative shocks don't always translate to

local AC-level vote shifts — a critical insight for the simulation. The model should NOT over-weight "national news cycle" effects on local vote shares. Expected 2026 simulation output: ~52–56% TMC / ~32–37% BJP / ~5–8% SDA.

---

5. MURSHIDABAD (AC #64, Murshidabad, parent LS: Murshidabad)

Archetype: A1 — Muslim-majority border, but THIS specific AC is Hindu-majority within the LS | SIR-deletion epicentre

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Murshidabad parent)	~37%	~17%	~41% (CPI[M] Badaruddoza Khan won)	Abu Taher Khan (TMC)	2.3 lakh
2016 AE	34.5%	1.8%	**47.7% (INC, Shaoni Singha Roy)**	INC	25,139
2021 AE	**41.3%** (93,476)	**42.4%** (95,967)	~13% (INC + Left + ISF)	**Gouri Sankar Ghosh (BJP)**	**2,491 votes**
2024 LS (Murshidabad parent)	~52% (Abu Taher Khan won)	~28%	~14% (CPI[M] Mohammed Salim)	TMC	1.6 lakh

Behavioural signal: The most volatile AC in our sample. INC's 47.7% in 2016 → CPI(M) won the parent LS in 2019 → BJP won AC in 2021 → TMC dominated parent LS in 2024. **The Hindu vote in this Muslim-majority district consolidated behind BJP in 2021** (riding the 2019 wave) but Muslim consolidation behind TMC at LS level overwhelmed it in 2024. The 2026 question is whether SIR deletions (Murshidabad lost 7.48 lakh names — 25% of district population) shift the Hindu-Muslim ratio at the booth level enough to flip this AC. Persona simulation should produce ~42–48% TMC / ~40–44% BJP / ~10–15% SDA. **This is the single seat where the model will be most stressed by SIR effects.**

---

6. COOCH BEHAR UTTAR (AC #3 SC-reserved, Cooch Behar, parent LS: Cooch Behar SC)

Archetype: A3 — North Bengal Rajbanshi | Sitalkuchi 2021 firing zone

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Cooch Behar parent)	~40%	~50% (Nisith Pramanik)	~6% (FB)	BJP	~54k
2021 AE	**43.4%**	**49.4%**	4.7% (AIFB)	**Sukumar Roy (BJP)**	**14,615 votes**
2024 LS (Cooch Behar parent — TMC flipped this LS!)	**43.25%** (Jagadish Chandra Barma Basunia, TMC)	**50.59%** (still ahead in this AC, but lost overall LS)	2.55% AIFB + 0.9% INC	TMC won LS overall	~40k

Behavioural signal: Beautiful demonstration of split-ticket / LS-AC divergence. TMC's vote share at AC level **didn't move** (40% → 43% → 43%); BJP's didn't move either (50% → 49% → 51%). What flipped Cooch Behar LS in 2024 was **other ACs in the LS** (Mathabhanga, Sitalkuchi, Sitai, Dinhata, Natabari) — not this one. **Cooch Behar Uttar is structurally BJP-Rajbanshi by 7-8 pp; the 2024 LS flip was driven by Muslim-majority parts of the LS.** The persona simulation should preserve this stability: ~43% TMC / ~50% BJP / ~5% SDA. If the model produces a TMC-flip here it has over-weighted the 2024 LS outcome.

---

7. JHARGRAM (AC #222, Jhargram, parent LS: Jhargram ST)

Archetype: A4 — Jangalmahal Santhal ST | ASA "No Vote to BJP" zone

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Jhargram parent)	~45%	~47% (Kunar Hembram)	~5% (CPI[M])	BJP	11,767 votes
2021 AE	**54.3%** (Birbaha Hansda, 1,09,493)	**35.3%** (Sukhmoy Satpati, 71,253)	5.2% (CPI[M] Madhuja Sen Roy)	**Birbaha Hansda (TMC)**	**38,240 votes**
2024 LS (Jhargram parent)	**47.49%** (Kalipada Saren)	**40.56%**	5.14% (CPI[M])	TMC	~1.7 lakh

Behavioural signal: Massive 2019 → 2021 swing, then partial reversion. BJP went from 47% (2019) → 35% (2021) → 41% (2024). TMC went 45% → 54% → 47%. **The 2021 spike for TMC was driven by Birbaha Hansda's celebrity candidacy + COVID-era Lakshmir Bhandar messaging + Adivasi alienation from BJP after the 2020 anti-Adivasi land remarks.** The 2024 partial

reversion shows the 2021 surge wasn't fully sustainable — BJP recovered ~6 pp. **This is the canonical "swing seat with mean-reverting behavior" — the simulation must reproduce this oscillation, not lock in either direction.** Expected 2026 output: ~47–52% TMC / ~36–42% BJP / ~5–7% SDA.

---

8. DIAMOND HARBOUR (AC #143, South 24 Parganas, parent LS: Diamond Harbour)

Archetype: A6 — South Bengal TMC heartland | Abhishek Banerjee's bastion

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Diamond Harbour parent)	**56.0%** (Abhishek, 7.91 lakh)	33.4% (Nilanjan Roy)	~9% (CPI[M])	TMC	3.21 lakh
2021 AE	**43.7%**	**36.2%**	**17.2%** (CPI[M] strong here!)	TMC (Pannalal Halder)	~7k margin
2024 LS (Diamond Harbour parent)	**69.1%** (Abhishek, 7.10 lakh winning margin)	**20.2%** (BJP collapse)	3.5% (CPI[M] Pratikur Rahaman) + 6% (Abdul Hasnat)	TMC	**7.10 lakh!!**

Behavioural signal: Diamond Harbour AC's 2021 result is anomalously *low for TMC* relative to Abhishek's LS dominance. **The AC-segment result was a 7-point TMC margin while Abhishek won the parent LS by 32 points.** This tells us Abhishek-effect doesn't fully transmit to local AC contests under another candidate. By 2024, with Abhishek consolidating his personal brand + Lakshmir Bhandar in full effect, TMC's LS share jumped to 69%. **For 2026 simulation, this is the test of whether the model captures the candidate-effect differential between AC-level (no Abhishek on ballot) and LS-level (Abhishek on ballot)**. Expected AC-level 2026: ~50–55% TMC / ~28–35% BJP / ~10–15% SDA.

---

9. KALCHINI (AC #11 ST-reserved, Alipurduar, parent LS: Alipurduars ST)

Archetype: A3 — North Bengal tea-garden ST | RSS Bharatiya Tea Workers Union zone

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Alipurduars parent)	~37%	**54%** (John Barla)	~5% (RSP)	BJP	2.44 lakh
2021 AE	**38.1%** (74,528)	**52.7%** (Bishal Lama, 1,03,104)	2.8% (INC) + ~3% RSP	**Bishal Lama (BJP)**	**28,576 votes**
2024 LS (Alipurduars parent — TMC partially clawed back at AC level)	**42.91%**	**50.74%**	1.55% (RSP)	BJP (Manoj Tigga, but margin shrunk vs 2019)	~75k

Behavioural signal: Tea-garden seats are BJP-locked but not BJP-immune. BJP held 51–53% across 2021 AE and 2024 LS, but TMC clawed back ~5 pp (38% → 43%) between 2021 and 2024 — suggesting **wage-promise messaging works at the margin**. Mamata's announced ₹300 daily wage and the BJP-affiliated tea workers' union losing some ground are visible in the data. Expected 2026 simulation: ~43–48% TMC / ~45–52% BJP / ~3% SDA. **This is the most BJP-stable seat in our sample after Bongaon Uttar; it should NOT flip under standard model assumptions.**

---

10. TARAKESWAR (AC #198, Hooghly, parent LS: Arambagh SC)

Archetype: A6 — Rural mixed Hindu, the "median Hindu Bengal voter" testbed

Election	TMC %	BJP %	Left/INC %	Winner	Margin
2019 LS (Arambagh parent)	**44.67%**	**42.47%**	8.0% (CPI[M]) + 1.7% INC	TMC (Aparupa Poddar, 1,142 votes!)	razor-thin
2021 AE	**46.96%** (96,698)	**43.33%** (Swapan Dasgupta, BJP, 89,214)	7.1% (CPI[M] Surajit Ghosh)	**Ramendu Singha Roy (TMC)**	**7,484 votes**
2024 LS (Arambagh parent)	**47.38%**	**41.96%**	7.49% (CPI[M])	TMC (Mitali Bag, 6,399 vote margin)	razor-thin again

Behavioural signal: The truest "swing seat" in our sample. TMC and BJP are within 5 pp of each other across three elections, with TMC very gradually pulling ahead (+2 pp from 2019 to 2024) and CPI(M) a stable 7–8% bystander. **No single event between 2019 and 2024 caused a**

sharp shift here — the rural mixed-Hindu OBC voter is genuinely persuadable but moves slowly. This is the seat that will tell us most about *median voter dynamics* under combined SIR + RG Kar + welfare effects in 2026. Expected 2026 simulation: ~48–51% TMC / ~40–43% BJP / ~7% SDA. **If the model produces a sharp swing here in either direction, the model is over-reactive.**

SYNTHESIS — Patterns Across the 10 Seats

Vote share delta table (2019 LS → 2024 LS, AC-segment level where available, parent LS where not)

Seat	TMC Δ	BJP Δ	SDA Δ	Type of behaviour
Nandigram	−4 pp	+14 pp	−7 pp	**BJP locked-in, 2021 → 2024 stable**
Bhabanipur	+4 pp	+1 pp	−3 pp	**TMC safe, no movement**
Bongaon Uttar	+2 pp	−0.7 pp	−2 pp	**Locked, BJP marginal slip**
Sandeshkhali	−2 pp	+3 pp	−3 pp	**Stable; Sandeshkhali violence didn't move local needle**
Murshidabad (AC)	+15 pp (LS-level)	+11 pp (LS-level)	−27 pp (Left collapse)	**Volatile — Left voters split between TMC & BJP**
Cooch Behar Uttar	+3 pp	+0.5 pp	−3 pp	**AC-level static; LS flipped due to OTHER ACs**
Jhargram	+2 pp	−6 pp	0 pp	**Mean-reverting after 2021 TMC spike**
Diamond Harbour	+13 pp	−13 pp	−5 pp	**TMC consolidated as Abhishek brand strengthened**
Kalchini	+6 pp	−3 pp	−3 pp	**TMC clawing back tea-garden vote slowly**
Tarakeswar	+3 pp	−0.5 pp	−0.5 pp	**Median-voter slow drift to TMC**

Three behavioural archetypes the simulation must reproduce

1. **Locked seats** (Nandigram, Bhabanipur, Bongaon Uttar, Cooch Behar Uttar, Diamond Harbour, Sandeshkhali) — vote shares stable within ±3 pp across two elections. Model should NOT produce dramatic flips here.
2. **Slow drift seats** (Tarakeswar, Kalchini) — directional movement of 3–6 pp over 5 years driven by welfare uptake and gradual community-level realignment. Model should produce

small, directionally consistent changes.

3. **Volatile seats** (Murshidabad, Jhargram) — capable of 10+ pp swings driven by event shocks (Left collapse, Adivasi mobilisation, candidate effects, SIR deletions). Model needs explicit event-shock variables here.

Calibration test for the 2024 LS back-test simulation

For the simulation to be considered "calibrated", it must reproduce these 2024 LS shares within ±3 pp at AC-segment level:

Seat	TMC target	BJP target	SDA target
Nandigram	46%	50%	3%
Bhabanipur	52%	37%	9%
Bongaon Uttar	43%	48%	5%
Sandeshkhali	55%	31%	6%
Murshidabad (AC)	47%	42%	11%
Cooch Behar Uttar	43%	51%	4%
Jhargram	48%	41%	5%
Diamond Harbour	65%	25%	8%
Kalchini	43%	51%	3%
Tarakeswar	47%	42%	7%

If the persona-based simulation reproduces these 10 numbers within ±3 pp using only 2019-era priors + Census 2011 demographics, the model is validated and ready to forecast 2026 with SIR + post-RG Kar event shocks layered on.

Data caveats

- 2019 AC-segment shares for some seats are estimated from the parent LS aggregate; precise booth-level 2019 data exists but requires deeper ECI Form-20 mining.
- 2024 LS AC-segment shares are reliable for Bongaon, Jhargram, Diamond Harbour, Kalchini, Tarakeswar (per Indiastat factbooks). For the others, parent LS shares are used as proxies.
- The 2021 Bhabanipur figure shown is the by-election (Sep 2021), which is anomalously high for TMC due to CM-incumbent dynamics. The pre-by-poll AE result (Sobhandeb

Chattopadhyay, May 2021) gave TMC ~58% — that's the more representative number for simulation.

- Murshidabad AC's 2024 LS-segment-level number is approximated; precise figure requires ECI Form-20.
